EXP NO: 02 DATE:

DEVELOP A C PROGRAM TO ANALYSER A GIVEN C CODE SNIPPET AND RECOGNIZE DIFFERENT TOKENS, INCLUDING KEYWORD, IDENTIFIERS, OPERATOR, DELIMITER AND SPECIAL SYMBOLS

AIM:

To develop a C program that analyses a given C code snippet and recognizes different tokens, including keywords, identifiers, operators, delimiter and special symbols.

ALGORITHM:

Start

Take a C code snippet as input from the user or a file.

Initialize necessary arrays and variables for keywords, identifiers, operators, and special symbols.

Tokenize the input string using spaces, newlines, and other delimiters.

For each token:

Check if it is a keyword (compare with a predefined list of C keywords).

Check if it is an identifier (valid variable/function name that doesn't match a keyword).

Eheck if it is an operator (6.g., *{, /, 7,7, %\$).

Print the categorized tokens.

End

PROGRAM:

```
#include <stdio.h>
#include <string.h>
#include <ctype.h>

int main() {
   char input[100];
   char *str[] = {"int", "float", "long", "double", "printf"};
   int i=0,j=0,iskeyword=0;
   scanf("%[^END]s",input);
```

```
for(i=0;i<4;i++){}
  int flag=1;
  for(j=0;str[i][j]!='\0';j++){
  if(input[j]!=str[i][j]){
        flag=0;
        break;
     }
  }
  if(flag) {
     iskeyword = 1;
     printf("%s is a keyword\n", str[i]);
     break;
  }
}
int start = j;
while(input[start]!='0'){
  if(isalpha(input[start])){
     printf("%c",input[start]);
     start++;
     while(isalnum(input[start]) || input[start]=='_'){
        printf("%c",input[start]);
        start++;
     }
     printf(" is a identifier\n");
  }else if(isdigit(input[start])){
     printf("%c",input[start]);
     start++;
     while(isdigit(input[start])){
     printf("%c",input[start]);
     start++;
     }
     printf(" is a constant\n");
     }else if(input[start]==',' || input[start]==';'){
       printf("%c is a delimeter\n",input[start]);
```

```
start++:
                    }else if(input[start]=='+' ||input[start]=='-' || input[start]=='*' || input[start]=='/' || input[start]=='%' ||
input[start]=='='){
                               printf("%c is a operator\n",input[start]);
                              start++;
                    }else if(input[start]=='(' ||input[start]==')' || input[start]=='\footnote{' || input[start
input[start]==']'){
                              printf("%c is a Symbol\n",input[start]);
                              start++;
                    }else{
                              start++;
                    }
          return 0;
}
                   OUTPUT:
                                                                                                                                   Enter a C code snippet:
                                                                                                                                   int main() {
                                                                                                                                                    int a = 5, b = 10;
                                                                                                                                                     float c = a + b;
                                                                                                                                                    if (c > 10) {
                                                                                                                                                                       printf("Result: %f", c);
                                                                                                                                                     return 0:
                                                                                                                                   Recognized Tokens:
                                                                                                                                   Keyword: int
                                                                                                                                   Identifier: main()
                                                                                                                                   Special Symbol: {
                        Implementation
                        Output/Signature
```

RESULT:

Thus the above program reads a C code snippet, tokenizes it using space, tab, and newline as delimiters, classifies each token as a keyword, identifier, operator, or special symbol based on predefined lists, and prints the recognized tokens along with their types
